SUMMARY

Data Science-focused B.Tech CSE student (CGPA 9.23) skilled in Python, SQL, machine learning, and data visualization. Built end-to-end ML systems for fraud and disease detection (up to 0.96 ROC-AUC) and automated workflows during an AI/ML internship, saving an estimated 8-10 hours/week. Experienced in ETL pipelines, explainable AI, and business-focused reporting.

EDUCATION

SRM Institute of Science and Technology Aug 2023 – Present
B.Tech in Computer Science and Engineering (Specialization: Data Science), CGPA: 9.23 *Chennai, India*

Radhwa International School May 2023
Grade 12 — Percentage: 77.4 *Yanbu, KSA*

EXPERIENCE

AI/ML Intern Dec 2025 – Jan 2026
SpeechLogix Technologies Pvt. Ltd.

- Built components of an AI-powered voice assistant on Asterisk (PBX) that handled ~400 automated customer calls in pilot testing, resolving ~65% of common queries without human intervention.
- Designed 6 voice-based call flows with escalation logic that routed complex cases to human agents with conversation context, reducing average handling time by ~15%.
- Cut agent workload by an estimated 8–10 hours/week by automating repetitive queries.

PROJECTS

Cardiovascular Disease Detection System | *ML, Python, Data Visualization,* GitHub May 2026

- Built a stacking ensemble using Random Forest, Extra Trees, XGBoost & Logistic Regression, achieving 84.20% accuracy and 0.8359 AUC.
- Applied SMOTE, feature preprocessing, threshold optimization (0.35) and 5-fold cross-validation, achieving 67.5% CVD-positive recall.
- Used SHAP Explainable AI to identify Blood Pressure, Age, Cholesterol, Glucose & BMI as key CVD predictors.

Sales & AI Insights Platform | *PySpark, PostgreSQL, LangGraph, Streamlit,* GitHub Jan 2025

- Built an end-to-end ETL pipeline using PySpark to clean and transform 15K+ sales records, loading into PostgreSQL with indexes, views, and a stored function for reporting.
- Designed a LangGraph-based agentic AI assistant enabling natural-language queries over the database, with multi-layer guardrails (read-only DB role, SQL validation, retry logic) to safely constrain LLM-generated queries.

Credit Card Fraud Detection System | *Python, Scikit-learn, SMOTE, Streamlit,* GitHub Oct 2024

- Built an end-to-end fraud detection system on 280K+ real-world credit card transactions with severe class imbalance (0.17% fraud), applying SMOTE strictly on training data to prevent data leakage.
- Benchmarked Logistic Regression, KNN, and LDA classifiers using Precision, Recall, F1, ROC-AUC, and PR-AUC rather than accuracy alone, since a naive model could hit 99.8% accuracy while catching zero fraud.
- Selected the final model based on recall-driven business trade-offs, achieving 87% fraud recall and 0.96 ROC-AUC, and deployed it via a Streamlit app for real-time transaction scoring.

TECHNICAL SKILLS

Languages: Python, SQL, C++, Java, JavaScript
Data Analysis: Pandas, NumPy, PySpark, Excel, Power BI, Matplotlib, Seaborn
Machine Learning: Scikit-learn, OpenCV, Feature Engineering, Classification, Regression, SMOTE, Streamlit
Web: React, Node.js, Express.js, Tailwind CSS
Databases: MySQL, PostgreSQL, SQLite, MongoDB
Tools & Cloud: Git, GitHub, VS Code, Jupyter Notebook, Google Colab, Google Cloud Platform

CERTIFICATIONS

- Data Analyst – SAP Analytics Cloud — SAP
- Tableau for Data-Driven Decision-Making — Coursera
- Computer Networking — Cisco
- Machine Learning — NPTEL
- DBMS: Master the Fundamentals and Advanced Concepts — Scaler
- Hadoop and Big Data Analytics — Simplilearn
